

Extend your mobile signal

The Telstra Go Repeater is a device designed to extend and maximise mobile coverage and improve voice quality and data speeds to your car, boat, home or place of work.

The device comes in two versions:

- A **stationary version** to provide better coverage at a permanent location, such as around farm buildings or at home. The stationary version is designed to resolve issues where an indoor signal may be weak or lacking.
- A **portable version** to boost coverage in vehicles. The portable version is suitable if you travel between coverage areas or through areas of patchy mobile coverage.

The Telstra Go Repeater can be purchased from Telstra, the **portable version (\$864 – full price)** includes an external magnetic mount antenna and internal antenna. We recommend installation by an auto-electrician.

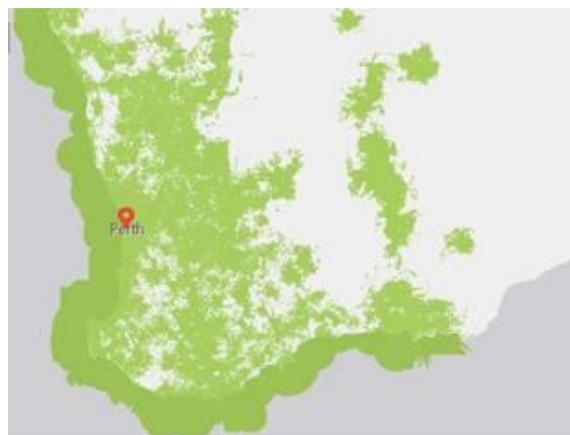

The **stationary version (\$816 – full price)** requires an external antenna at an additional cost and it should be professionally installed by Telstra or Telstra partner.

The Telstra Go Repeater is designed to work without interfering with the overall mobile network. This is very different to illegal mobile repeater devices that don't have the internal protection of Telstra approved devices. Illegal devices can also cause major interference on the network, so it is important to only use Telstra approved network extension devices like the Telstra Go Repeater.

For Shire of Dumbleyung residents we are offering a \$100 discount - please email telstrawa@team.telstra.com and quote reference DUMBLEYUNG22
